The first necessary pass is to extract the zip/tarball package in a place (subsequently named here as <fbjava-root> - this is the parent directory of the packaged bin and others directories).

The second pass is to include a line in the end of <firebird-root>/plugins.conf file pointing to the plugin:

include <fbjava-root>/conf/fbjava.conf

```
Firebird
  plugins
    udr
      fbjava
        conf
          fbjava.conf
        fbjava-1.0.0-alpha-1.jar
        META-INF
        ogr
```

include \$(dir_plugins)/udr/fbjava/conf/fbjava.conf

```
fbjava.conf
Plugin = JAVA {
  Module = $(this)/..lib/libfbjava
  Config = JAVA_config
}
Config = JAVA_config {
#  JavaHome = /opt/jdk1.8
# JvmArgsFile = $(this)/jvm.args
  SecurityDatabase = $(this)/java-security.fdb
```

}
